Project Title:	Car Rental Management System
-----------------------	-------------------------------------

Project Description:

This system simplifies car rentals by managing customer details, car availability, rental records, payments, and locations. Customers can sign up, rent multiple cars, and each car has a unique number, model name, and status. The system tracks when cars are rented and returned, ensuring availability. Payments include details like payment method, time, and status, while the system records car locations to manage inventory effectively. Each car is assigned to a specific location, making it easy to check availability. This setup ensures that the system is well-organized and can handle cars at multiple locations seamlessly. The rental process involves customer registration, car selection, rental duration, and payment. The system updates rental records, changes car availability, and tracks late returns, improving efficiency and reducing errors. Every rental links to a payment record, ensuring accurate financial tracking. By managing the relationships between customers, cars, locations, rentals, and payments, the system ensures smooth operations, accurate records, and proper financial handling, with an easy-to-use interface for both customers and admins. Additionally, it provides insights into usage patterns and rental trends, helping businesses make informed decisions. It has a simple interface for both customers and admins, making car rentals more efficient and easier to use. Frontend - html, css, js and Backend - jsp, servlet, jdbc and MySQL .
